

UNITED STATES DISTRICT COURT  
NORTHERN DISTRICT OF NEW YORK

-----X  
R.M. BACON, LLC and MICHAEL BACON,

Plaintiffs

Case Number: 17-cv-441 (LEK/DJS)

- v -

**SECOND AMENDED  
COMPLAINT**

SAINT-GOBAIN PERFORMANCE PLASTICS  
CORP., HONEYWELL INTERNATIONAL  
INC. f/k/a ALLIED-SIGNAL INC., and/or  
ALLIEDSIGNAL LAMINATE SYSTEMS,  
INC., E.I. DUPONT DE NEMOURS  
AND COMPANY and 3M CO.,

**DEMAND FOR JURY TRIAL**

Defendants.  
-----X

Plaintiffs, by and through their attorneys, as and for their second amended complaint against Defendants Saint-Gobain Performance Plastics Corp. (“Saint-Gobain”) and Honeywell International Inc. f/k/a Allied-Signal Inc. and/or AlliedSignal Laminate Systems, Inc. (Honeywell), E.I. DuPont De Nemours (DuPont) and Company and 3M Co. (3M)(collectively, Defendants), allege as follows:

**INTRODUCTION**

1. R.M. Bacon, LLC (“R.M. Bacon” or Company) is one of the direct and immediate victims of Defendants’ systematic contamination of the local aquifer. Defendants’ actions, in short, have caused the collapse of a 30-year old local business.

2. Unknown to plaintiffs, Defendants were responsible for the contamination of the local environment with a dangerous chemical called perfluorooctanoic acid, commonly referred to as PFOA. When consumed, PFOA can cause numerous and serious health issues.

3. The Defendants are responsible for the contaminated the local aquifer with this chemical, which has resulted in a significant number of individuals suffering from severe impairments of their health and most suffering property damage.

4. On May 19, 2016, the U.S. Environmental Protection Agency issued a new health advisory for PFOA (and a related chemical, PFOS), setting lifetime exposure to PFOA and PFOS from drinking water at 70 parts per trillion (ppt). Upon information and belief, the level of PFOA in Hoosick Falls' municipal water supply has exceeded 500 ppt for years, if not decades.

5. The State of New York has identified Saint-Gobain and Honeywell as two of the parties, if not the only parties, potentially responsible for the contamination of the groundwater in Hoosick Falls.

6. On January 27, 2016, Governor Cuomo directed New York state agencies to use Superfund money to address PFOA in the Hoosick Falls' water system and in private wells. The primary Saint-Gobain site in Hoosick Falls was declared, at that time, a State Superfund site. The State has since described the site as a "significant threat to public health or the environment."

7. Defendants, in whole or in part, contaminated the aquifer beneath Hoosick Falls with PFOA.

8. The PFOA contamination within the local water supply has had a direct and adverse economic impact on plaintiffs R.M. Bacon, LLC and Michael Bacon.

### **PARTIES**

9. Plaintiff R.M. Bacon is a New York corporation located at 510 South Street, Hoosick Falls, New York.

10. Plaintiff Michael Bacon mailing address is P.O. Box 136, Hoosick Falls, New York and he resides at 669 South Street, Hoosick Falls, New York.

11. Defendant Saint-Gobain Performance Plastics Corporation is a foreign company with its principal executive office located at 750 East Swedesford Road, Valley Forge, Pennsylvania.

12. Saint-Gobain is a Paris-based multinational corporation with more than 350 years of engineered materials expertise. Saint-Gobain is one of the top 100 largest industrial companies in the world with € 43.2 billion in sales and 193,000 employees in 64 countries. Saint-Gobain employs approximately 1,200 people in New York.

13. Saint-Gobain is the world's leading producer of engineered, high-performance polymer products, serving virtually every major industry across the globe. Saint-Gobain businesses support these key industries in bringing advanced technology polymer products and using them in the most demanding applications.

14. Defendant Honeywell International (Honeywell), f/k/a Allied-Signal Inc., is a foreign corporation with its principle executive office located at 115 Tabor Road, Morris Plains, New Jersey.

15. Honeywell is a Fortune 100 company with a global workforce of approximately 130,000. It serves a variety of industries, including the specialty chemicals industry.

16. In 1999, Allied-Signal Inc. acquired Honeywell. The combined company adopted Honeywell's name, however, because of superior name recognition.

17. Allied-Signal was an aerospace, automotive, and engineering company that was created through the 1985 merger of Allied Corp. and Signal Companies. Together, these

companies had operated in the United States since at least the early 1920s. Prior to the merger, a significant portion of Allied Corp.'s business was concerned with the chemical industry.

18. At all relevant times, AlliedSignal Laminate Systems, Inc. was a unit of Allied-Signal.

19. Defendants Saint-Gobain and Honeywell (through its predecessor Allied-Signal and/or AlliedSignal Laminates), at various times relevant herein, and as described more fully below, operated a manufacturing facility at or around 14 McCaffrey Street, Hoosick Falls, New York, and 1 Liberty Street, Hoosick Falls, New York. Defendant Honeywell also operated facilities on John Street/3 Lyman Street in Hoosick Falls, New York, Liberty Street in Hoosick Falls, New York and on River Road in Hoosick Falls, New York.

20. Defendant E.I. DuPont De Nemours and Company (DuPont), is and was at all times relevant hereto a corporation organized under the laws of Delaware with its principal executive office located at 974 Centre Rd., Wilmington, DE. DuPont is registered to do business as a foreign corporation in the State of New York. At all times relevant hereto, DuPont manufactured and sold ammonium perfluorooctanoate (APFO) and/or polytetrafluoroethylene (PTFE) dispersions containing APFO to Defendants Saint-Gobain and Honeywell that were used at these Defendants' facilities in their manufacturing processes as described herein.

21. Defendant 3M Co. (3M) is and was at all times relevant hereto a corporation organized under the laws of Minnesota with its principal executive office located at 3M Center Building 220-11W-02, Saint Paul, Minnesota. Defendant 3M manufactured and sold APFO to Defendants Saint-Gobain and Honeywell that was used at these Defendants' facilities in their manufacturing processes as described herein.

22. Defendant 3M manufactured and sold APFO to DuPont and other manufacturers for inclusion in polytetrafluoroethylene (PTFE) and fluorinated ethylene propylene (FEP)<sup>1</sup> dispersion products at least through 2000, and some of these PTFE and FEP dispersions were sold to Defendants Saint-Gobain and Honeywell and used at these Defendants' facilities in their manufacturing processes as described herein.

23. Defendant DuPont manufactured and sold APFO after 2000, to other manufacturers for inclusion in PTFE dispersion products up through 2015 and these PTFE dispersion products were sold to Defendants Saint-Gobain and Honeywell and used at these Defendants' facilities in their manufacturing processes as described herein. Defendant DuPont also sold APFO directly to Defendant Saint-Gobain between 2000 and 2015.

### **JURISDICTION AND VENUE**

24. Jurisdiction is proper in this Court due to diversity of citizenship, pursuant to 28 U.S.C. § 1332(a), because the parties are citizens of different states and the amount in controversy exceeds \$75,000, exclusive of interest and costs.

25. Venue is proper in this Court pursuant to 28 U.S.C. § 1391(a) because Defendant Saint-Gobain conducts substantial business in this District, and has caused harm to the plaintiffs, who resides in this District.

---

<sup>1</sup> References to PTFE dispersions are intended to also include FEP dispersions and other PFOA-containing products manufactured by Defendants DuPont and 3M.

## **GENERAL FACTUAL ALLEGATIONS**

### **Background Regarding PFOA**

26. Ammonium Perfluorooctanoate (APFO) dissociates in water to form perfluorooctanoate (PFO<sup>-</sup>) and under acidic conditions is protonated to form perfluorooctanoic acid (PFOA).<sup>2</sup>

27. PFOA is a fluorinated organic chemical that is part of a larger group of chemicals referred to as perfluoroalkyl substances (PFASs) or perfluorochemical compounds (PFCs) that include perfluorooctane sulfonic acid (PFOS).

28. PFOA and all PFCs are human-made chemicals that are not found in nature.

29. Defendant 3M is the inventor and original manufacturer of PFOA having begun manufacturing the chemical in approximately 1947 at its Cottage Grove plant in Minnesota. It ceased manufacturing PFOA in or about the year 2000.

30. Defendant DuPont began using PFOA (also referred to as C-8) in dispersion polymerization in the manufacture of fluoropolymers at its Washington Works plant in West Virginia in the 1950s.

31. Defendant DuPont began manufacturing PFOA after Defendant 3M chose to stop making the chemical in 2000 and DuPont then continued to manufacture PFOA and use it in its manufacturing processes after 2000. Defendant DuPont also sold PFOA to other manufacturers of PTFE and FEP dispersions once it took over manufacturing the chemical from 3M after 2000.

---

<sup>2</sup> For purposes of this complaint, APFO, PFO<sup>-</sup> and PFOA will all be generically referred to as “PFOA.”

32. Historically, PFOA was used as a polymerization aid and as a dispersion and wetting agent in the manufacturing of fluoropolymers. PFOA was also used in manufacturing a variety of consumer products to achieve water, oil, and grease repellency.

33. Prior to 2015, companies utilized PFOA to make, among other things, carpets, clothing, fabrics for furniture, paper packaging for food and other materials such as cookware that are resistant to water, grease or stains.

34. PFOA was also a key component in the manufacturing of PTFE (Teflon®) and other similar coatings. In this process, PFOA was used as a surfactant, dispersing and wetting agent. PFOA was not intended to be incorporated into the final product, although trace amounts remain.

35. PFOA is a white solid at ambient temperature, but exists as a vapor when heated during the process of PTFE (Teflon®) manufacturing and coating. When PTFE coatings are heated PFOA vaporizes out of the PTFE dispersion and exits through stacks in manufacturing facilities. When hot PFOA vapor exits through the stacks and cools, it condenses back into solid form and, within minutes, it coagulates and forms micro-sized particulates ranging from 0.1 um to 1 um in diameter that are then carried by the wind until they settle to the ground (dry deposition) or are washed from the atmosphere by precipitation (wet deposition). PFOA is highly water soluble and its particulate matter is carried by the wind and settles into soil where it dissolves into rainwater and other precipitation and then readily percolates down to contaminate groundwater.

36. Due to its chemical structure, PFOA is biologically and chemically stable in the environment and is resistant to environmental degradation processes. It is particularly persistent in water and soil and, because PFOA is water-soluble, it can migrate readily from soil to groundwater. PFOA remains present in the environment long after it is initially released.

37. In 2006, the Environmental Protection Agency (EPA) implemented a global stewardship program that included eight major perfluoroalkyl manufacturing companies, including Defendants DuPont and 3M. The stewardship program's goal was (i) to achieve a 95% reduction of global facility emissions of PFOA and chemicals that degrade to PFOA by 2010, and (ii) to eliminate PFOA from emissions and products by 2015. According to EPA, all eight companies that participated in the program have attested that they phased out PFOA, and chemicals that degrade to PFOA, from emissions and products by the end of 2015.

### **PFOA-Associated Health Risks**

38. There are a number of health risks associated with exposure to PFOA, and these risks are present even when PFOA is ingested at, seemingly, very low levels (less than 1.0 part per billion (ppb)).

39. Defendant DuPont had received inquiries regarding the toxicity of PFOA as early as 1954 and began to be concerned about its toxicity.

40. In or about 1961, toxicologists working for Defendant DuPont concluded that PFOA was toxic. Its toxicology section chief stated it should be "handled with extreme care." DuPont researchers also found that exposure to PFOA causes an increase in the size of the livers in rats and rabbits. In 1962 the same effect was discovered by DuPont scientists when PFOA was ingested by dogs. Internal documents from Defendant 3M show that company scientists had been aware of the health risks of PFOA as early as the 1960s.

41. In 1970, Defendant DuPont became aware that a large group of company foremen and salesmen at its Washington Works facility in West Virginia where Teflon® manufacturing took place, had higher incidence rates of myocardial infarction, cerebrovascular disease, diabetes

mellitus and cancer than its high level executives at the facility who were not involved directly in manufacturing operations.

42. In 1976, researchers from the University of Rochester, New York published a report that showed widespread contamination of human tissues with organofluorine compounds (organic compounds that contain the carbon-fluorine bond) which likely derived from commercial sources such as PFOA. The authors contacted Defendant 3M questioning whether its consumer products containing these compounds could be the source. J.D. LaZerte of 3M advised W.S. Guy, one of the researchers on the project, “not to speculate” on the source of the organofluorine compounds found in human tissues and, upon information and belief, 3M took no further action to investigate this issue.

43. By 1978, Defendant 3M had found elevated organic fluorine levels in the blood of its workers exposed to fluorinated surfactants such as PFOA.

44. When Defendant DuPont learned of these elevated levels in 3M workers, it too began an internal review to determine its workers’ C-8 (PFOA) concentrations and documented high concentrations of PFOA in the blood of its factory workers at its Washington Works plant in West Virginia, showing that PFOA bioaccumulates and is not easily removed from the body.

45. In 1978, Bruce Karrh, M.D., Defendant DuPont’s Corporate Medical Director, published an article in a professional journal stating: “It is the duty of every company’s management to discover and reveal the unvarnished facts about health hazards. . . . [A] company should disclose health-hazard information. It should be candid, and lay all the facts on the table. This is the only responsible and ethical way to go. This approach is the correct one, of course and it is the way we try to proceed at DuPont.”

46. By September of 1978, Defendant DuPont had reviewed medical records of 11 operators and 18 laboratory workers with long-term exposure to PFOA and found that more of them than anticipated had abnormal liver function tests (elevated liver enzymes in their blood serum).

47. In the late 1970s, Defendant 3M consulted with Dr. Harold C. Hodge of the University of Rochester. At a meeting in 1978, Dr. Hodge told 3M's Medical Director, Dr. F.A. Ubel, that physical examination results of employees should be compared with controls. "There appears to be indications of liver change from the physical examination results. In terms of indicators of liver disorder, there are [sic] a higher percentage of Chemolite [one 3M facility] than at Decatur [another 3M facility] and the organically bound fluorine level at Chemolite is correspondingly higher." Dr. Hodge indicated to 3M at this time that a potential hazard was present regarding organofluorine chemical exposure to its workers.

48. A joint meeting was held in 1979, between Defendant 3M's fluorochemical exposure committee and Defendant DuPont's Eugene Berman and several of his DuPont colleagues. Both companies' representatives agreed that since there were no *established* adverse health effects associated with the findings of accumulated fluorochemicals in the blood of workers at the two companies there was no reason to provide an 8E notification under TSCA to the Environmental Protection Agency regarding these findings. Minutes from the meeting indicate that a discussion transpired between the two companies as to whether they would make any efforts to seek evidence of a possible association between worker blood levels and illness: "DuPont was asked if they had carried out any chronic studies on fluorochemicals in the past and if they planned any in the future. In both cases the answer was negative. Fluorochemicals have a low priority in

their chronic testing program. They would not carry out such studies unless they were forced to by regulations.”

49. In 1979, Defendant DuPont learned that PFOA caused metabolic abnormalities, including uncoupling of oxidative phosphorylation in rat liver mitochondria that were oxidizing succinate. It also learned that PFOA seemed to alter the immunochemical reaction of bovine (cow) serum albumin. It also was aware at that time that: 1) PFOA caused liver enlargement in rats and death at high doses; 2) increases in plasma enzyme levels indicative of cellular damage in dogs and death at high doses; and; 3) inhaled doses in rats for only four hours could cause liver enlargement and corneal opacity.

50. Based upon the adverse health effects of PFOA on laboratory animals, in 1979, Defendant DuPont established a provisional PFOA acceptable exposure level for its employees of 0.01 mg/m<sup>3</sup> in air based upon an 8-hour time-weighted average exposure.

51. In 1979, Defendant DuPont found increased PFOA levels in the blood of eight workers who worked in the FEP polymerization and TFE dispersion polymerization processes, with the average blood level for PFOA among the eight workers being 8.2 ppm (8,200 ppb).

52. In 1979, Defendant DuPont was aware that blood test results of its Washington Works employees from 1978, showed that organic fluoride levels were associated with increases in SGOT levels in blood serum. SGOT (now more commonly referred to as AST) is a liver enzyme which when found at increased levels in blood serum is a sign of possible liver damage.

53. In 1979, Defendant DuPont was aware “compound-related effects” (effects related to PFOA) were observed in both Rhesus monkeys and Charles River CD rats, but that “monkeys were more severely affected of the two.” It learned that “the data on monkeys suggested increased incidences of chronic interstitial nephritis [kidney damage], hyperkeratosis in the skin and a slight

increase in skeletal muscle atrophy .... Similarly, the data on rats suggest hepatocellular necrosis [liver damage], sinusoidal liver congestion and the presence of yellow-brown pigment in the epithelium of the convoluted tubules of the kidney.”

54. By 1979, Defendant DuPont was aware that a 90-day oral study in Rhesus monkeys had been administered at dosage levels of 0, 3, 10, 30 and 100 mg/kg/day of PFOA, with the monkeys receiving the highest dose dying during weeks 2-5 of the study, three of the monkeys receiving the 30 mg/kg/day dose also died during weeks 7-12 of the study while all monkeys exposed at this dose showed signs of toxicity in the gastrointestinal tract and other adverse changes. Monkeys dosed at the two highest levels also showed weight loss from the first week of the study.

55. Early PFOA toxicology studies commissioned by Defendant 3M were summarized in 1980 and the liver was highlighted as a target organ, while effects on the immune system were also reported. The study reports were not submitted to the EPA until 2000, the year Defendant 3M decided to stop manufacturing PFOA.

56. In 1980, PFOA animal toxicity studies were published by Griffith and Long in the JAIHA.

57. By 1980, Defendant DuPont had internally confirmed that PFOA “is toxic,” “people accumulate” the chemical in their bodies after exposure and “continued exposure is not tolerable.” At this same time Defendant DuPont documented that sixteen of its workers had PFOA blood serum levels of between 4.97 ppm and 21.69 ppm (4,970 ppb and 21,690 ppb).

58. In 1980, DuPont was aware that the rate of first time myocardial infarctions (heart attacks) in company foreman at its Washington Works facility was almost double what would have been expected.

59. In materials from a C-8 Communications meeting, dated July 31, 1980, D.E. Steiner, an employee of Defendant DuPont, stated: “After 25 years of handling C-8, we see no damage among workers. However the potential is there – C-8 has accumulated in the blood. Because of this accumulation we have decided to undertake programs to minimize accumulation of C-8 in the blood in the workers.”

60. By 1981, Defendant DuPont was aware that PFOA in the blood serum of a pregnant woman could cross the placenta to the fetus. PFOA was found to be present in the umbilical cord blood of an infant born to an employee and in the blood of an infant born to another employee.

61. By 1981, Defendant 3M was aware that PFOA ingestion caused birth defects in rats. Acting on this information Defendant DuPont surveyed children born to workers of its Teflon Division and found birth defects in two of seven children born to PFOA exposed workers, both of whom had eye defects.

62. An experimental study conducted by Defendant 3M in 1981 showed birth defects in the eye lens of rats exposed to PFOA. A total of three teratology studies were carried out, all of them finding lens abnormalities in exposed animals. In March 1981, Defendant 3M informed Defendant DuPont of the rat study. DuPont then removed all female employees from PFOA exposed jobs, but did not inform them of the reason for their transfer.

63. By the early 1980’s Defendants DuPont and 3M were sharing their internal studies concerning health and environmental effects associated with exposure to PFOA that Defendants were not sharing publicly.

64. In 1982, Defendant DuPont calculated that approximately 40 percent of the PFOA vapor inhaled was retained in the blood of human males.

65. A cross-sectional study of worker health at 3M's Chemolite plant in Cottage Grove, Minnesota was summarized by a 3M medical officer in 1982 as showing a high prevalence of high blood pressure and elevation of cholesterol. No apparent effort was made to compare the incidence of these conditions to PFOA or PFOS blood levels and the authors concluded that this observation was caused by worker lifestyle, not occupational exposures.

66. On November 23, 1982, Defendant DuPont's Medical Director, Bruce Karrh, MD, wrote in an internal memorandum: a) "Our knowledge of the product health effects of long-term exposure to low levels of C-8 is quite limited"; b) "C-8 is retained in the blood for a long time, creating concern in other areas such as blood donations, etc."; and c) "All employees, not just Teflon area workers, are exposed."

67. By September of 1984 Defendant 3M's medical service team noticed an increasing trend in worker organic fluorine concentrations in blood testing that had begun eight years earlier. The team advised "we must view this present trend with serious concern . . . exposure opportunities are providing a potential uptake of fluorochemicals that exceeds excretion capabilities of the body."

68. Thereafter, Defendant 3M decided to search to see if it could find any blood samples among its workers that were free of organofluorine compounds. When this was unsuccessful, an internal 3M document proposed: "It is in the interest of 3M to strengthen the evidence of non-industrial sources of organic fluorine in normal human blood." 3M initiated efforts beginning in 1993, to show that organic fluorine in blood could be from entirely natural sources, but was unable to find any data to support this hypothesis.

69. By June 14, 1984, Defendant DuPont was aware from analysis of blood testing of former Teflon Division employees that the average biological half-life of PFOA in human blood was approximately 2.4 years, but with considerable variability between individuals.

70. In 1984, Defendant DuPont was aware that male operators in the Teflon division that had worked there for many years had complained about difficulty in achieving pregnancy with their wives.

71. By 1986, Defendant DuPont was aware of a cancer morbidity study among its Washington Works employees that showed male hourly wage workers had an incidence of bladder cancer deaths at more than double what would have been expected.

72. By 1987, Defendant DuPont was aware through a study conducted of its Chamber Works plant in Deepwater, New Jersey, where fluorochemicals were used, that there were increases above expected rates of death from female breast cancer, bladder cancer, Hodgkin's disease, lung cancer, urinary cancers in men and cirrhosis of the liver in women.

73. On June 12, 1987, H.A. Smith, of the Safety, Energy & Environmental Affairs office of Defendant DuPont's Manufacturing Division made a request to DuPont's Haskell Laboratory that they establish an acceptable level of PFOA in the blood and an acceptable level of PFOA in drinking water.

74. By 1988, Defendant DuPont was aware that PFOA was associated with increased rates of carcinogenicity in rats, including testicular cancer.

75. On March 9, 1988, Defendant DuPont first recommended a drinking water limit for PFOA of 1 ug/L (ppb). This guideline was adopted by DuPont in June of 1991.

76. In 1989, a study by Defendant DuPont of cancer incidence among its Washington Works employees detected an increased incidence of leukemia, buccal cavity and pharynx cancer, kidney and other urinary cancers, including bladder cancer and multiple myeloma.

77. By 1989, Defendant DuPont was aware that there were increases in other cancers at its Chamber Works facility as well, including pancreatic, lung, kidney and bladder cancers and Hodgkin's disease.

78. An internal DuPont memo dated December 14, 1989, entitled "Washington Works: Cancer Incidence and Overall Mortality Rates" indicates that among Washington Works employees there was an increased incidence over expected of testicular cancer, kidney cancer and other urinary cancers.

79. By 1990, Defendant DuPont was aware that among its Chamber Works employees there was a statistically significant excess of deaths due to urinary cancers, a statistically significant increased incidence of bladder cancer in male employees, a statistically significant increase in mortality from cancer of the digestive organs among female employees and female employees continued to have a statistically significant elevation in the incidence of cirrhosis of the liver.

80. A 1990 DuPont internal industrial hygiene data review demonstrated a correlation between PFOA levels in the air and PFOA blood levels in workers who inhaled contaminated air. It was found that levels in blood were an order of magnitude or more higher than the levels in the air, which demonstrated that PFOA bioaccumulated inside the human body.

81. In a DuPont report, dated April 12, 1990, entitled "Investigation of Hormonal Mechanisms for C-8 Induced Leydig Cell Adenoma" by Mark Hurtt and Jon Cook of DuPont's Haskell Laboratory, which reviewed data derived from a 3M animal study, the authors concluded

that the induction of Leydig cell adenoma (testicular tumors) related to PFOA exposure was likely to be hormonally mediated.

82. By October 1990, Defendant DuPont learned that PFOA induced a dose-related decrease in serum testosterone, which appeared to document a direct effect of PFOA on the testes.

83. On March 15, 1991, Wayne H. Martin of Defendant DuPont's regulatory affairs department sent a memo that reported on a meeting at which he and other DuPont employees decided that "A warning of potential C-8 hazards (especially from condensate) should be included in MSDSs for all products in which C-8 concentration is 0.1% or more." It also indicated that all other "product literature which contains safety or health warnings should be revised to be consistent with MSDS."

84. In October 1991, an internal proposal to conduct a cross-sectional study of liver enzyme levels among Washington Works employees with potential exposure to PFOA was rejected by Defendant DuPont's management. In notes from a meeting when this proposed study was considered, a DuPont employee wrote: "Do the study after we are sued."

85. In the unpublished 1992 thesis of Frank Gilliland, MD who studied the clinical pathology parameters of 111 male workers at Defendant 3M's Chemolite plant in Cottage Grove, MN, Dr. Gilliland found a positive correlation between PFOA exposure measured as serum total organic fluorine and estradiol (an adverse effect) and a negative correlation with free testosterone (also an adverse effect) with this association being stronger in older men. Dr. Gilliland concluded that PFOA may affect male reproductive hormones.

86. Dr. Gilliland's 1992 unpublished thesis from his 3M worker study also showed thyroid effects in 3M production workers that were associated with organofluorine concentrations

in worker blood serum. A positive correlation was seen between organic fluorine and the thyroid stimulating hormone in serum, a sign of thyroid deficiency.

87. An internal document from Defendant DuPont acknowledged that at doses of 300 ppm PFOA caused statistically significant increases in adenomas and carcinoma of the liver, pancreas and Leydig cell adenomas in the testis. Thus, by 1993, DuPont was aware of two animal studies that found that PFOA caused testicular cancer and DuPont knew that PFOA caused cancer at three different anatomical sites among laboratory animals exposed to PFOA.

88. By 1993, Defendant 3M began to monitor PFOA levels in the blood serum of its production workers and conducted a mortality study of such workers showing a 3-fold excess occurrence of prostate cancer in workers employed more than ten years.

89. When Defendant 3M discussed DuPont's results on cancer in male rats with colleagues from the UK company ICI in 1995, the latter strongly espoused that APFO should be considered an animal carcinogen, as the benign tumors observed are simply early lesions that ultimately lead to malignant tumors, but 3M representatives disagreed.

90. By 1996, Defendant DuPont was informed that testing linked PFOA to damage to DNA.

91. In or about 1996, Defendants DuPont and 3M jointly commissioned studies to assess the effects of PFOA on humans by exposing monkeys to the chemical. By November of 1998 Defendants DuPont and 3M were aware that monkeys in this study were suffering from severe health effects. By 1999 even the monkeys receiving the lowest dose of PFOA were suffering adverse health effects, including liver toxicity, and it was determined that there was no exposure level at which no observable effects could be found (NOEL) in non-human primates.

92. As of January of 1997, researchers at Defendant DuPont were aware of a hormonally-mediated mechanism for the Leydig cell tumors in rat testes. In a document entitled “Hazard Characterization for Human Health in C8 Exposures, CAS Registry No. 3825-26-1,” Lisa B. Biegel, Ph.D., Senior Research toxicologist at the DuPont Haskell Laboratory wrote: “The studies summarized below support a hormonally-mediated mechanism for the Leydig cell tumorigenesis: C8 produces an increase in hepatic aromatase activity, which elevates serum estradiol concentrations, which in turn modulates growth factors in the testes, which results in tumor formation.... The mechanism of tumorigenesis is not completely understood, and therefore relevance to humans cannot be completely ruled out. However, it is known that non-genotoxic compounds (such as C8) produce Leydig cell tumors by altering the endocrine system.”

93. A paper published in 1997, by John C. Cook of Defendant DuPont together with Eric D. Clegg, concluded: “Occurrence of Leydig cell adenomas in test species is of potential concern as both a carcinogenic and reproductive effect if this mode of induction and potential exposure cannot be ruled out as relevant for humans [and]... it should be assumed that humans are potentially susceptible.”

94. In 1999, Dr. Richard Purdy of Defendant 3M wrote to his 3M colleagues, Drs. John Butenhoff and Andrew Seacat that his calculations showed that a “general population member with [PFOA levels of] 70 ppb (in one’s blood) could have 36 times more in his liver” due to life-time accumulation.

95. In April 2000, Defendant DuPont rejected its occupational health official’s recommendation for a comprehensive medical surveillance program for employees exposed to PFOA, noting that establishing such a program “could have significant repercussions at any of our other sites that handle . . . similar products.”

96. In or about 2000, the EPA notified Defendant 3M that it intended to pursue more rigorous regulation of the perfluorinated chemicals manufactured by this Defendant. Shortly thereafter Defendant 3M publicly announced that it was voluntarily withdrawing from the perfluorinated chemical market, including its manufacturing of PFOA. Two of the reasons for Defendant 3M's decision were PFOA's bio-persistence and toxicity.

97. In October 2001, Paul M. Hinderliter, Ph.D. and Gary W. Jepson, Ph.D. of the DuPont Haskell Laboratory, drafted a paper entitled: A Simple, Conservative Compartmental Model to Relate Ammonium Perfluorooctanoate (APFO) Exposure to Estimates of Perfluorooctanoate (PFO) Blood Levels in Humans." The paper described calculations which showed that ingestion of 1 part per billion of PFOA in drinking water corresponded to human PFOA blood levels 300 times higher.

98. In March 2002, a Defendant DuPont website titled "C-8 INFORM" continued to state that PFOA had no adverse health effects: "In more than 50 years of C-8 use by DuPont and others, there have been no known adverse human health effects associated with the chemical. 3M and DuPont studies, as well as extensive other scientific data, support the position of no known adverse human health effects associated with C-8."

99. Before 2003, only one commercial laboratory in the United States had the capacity to detect perfluorocarbons such as PFOA in blood. DuPont's contract with that laboratory prohibited it from testing PFCs for other entities without the consent of DuPont.

100. In 2003, Defendant 3M conducted a mortality study of its workers exposed to PFOS, a chemical closely related to PFOA, and reported excess bladder cancer incidence with high exposure jobs.

101. A mortality registry kept by Defendant DuPont demonstrated an excess of kidney cancer deaths over expected levels for workers at the Washington Works plant.

102. In 2006, the U.S. EPA reached a settlement agreement with Defendant 3M to resolve 3M's alleged reporting violations under the Toxic Substances Control Act regarding its fluorochemicals. The agreement did not require 3M to admit the violations, but the company agreed to pay a penalty in excess of \$1.5 Million Dollars for 244 separate alleged violations.

103. In 2009, Defendant 3M performed a follow-up study of its workers exposed to PFOA which showed an increase in prostate cancer incidence in workers with moderate to high exposures.

104. Toxicology studies show that PFOA is readily absorbed after ingestion or inhalation exposure. PFOA has a half-life in the human body of 2 to 9 years. PFOA binds to albumen in the blood serum and is concentrated in the liver and kidneys. Indeed, PFOA is especially concerning from a human health standpoint precisely because it can stay in the environment and in the human body for long periods of time.

105. PFOA is associated in the medical literature with increased risk in humans of testicular cancer, kidney cancer, prostate cancer, non-Hodgkin's lymphoma, pancreatic cancer and ovarian cancer, as well as thyroid disease, high cholesterol, high uric acid levels, elevated liver enzymes, ulcerative colitis, and pregnancy-induced hypertension, as well as other conditions. Studies of PFOA exposure in animals have shown the ability to cause other cancers not yet associated with human exposure. The EPA has also advised that exposure to PFOA may result in developmental effects to fetuses during pregnancy or to breastfed infants, liver damage, and various immunological effects.

106. In May 2006, the EPA Science Advisory Board stated that PFOA cancer data are consistent with guidelines suggesting exposure to the chemical is “likely to be carcinogenic to humans.” These health conditions can arise months or years after exposure to PFOA.

#### **Knowledge of PFOA Environmental Contamination**

107. In 1966, Defendant DuPont became aware that perfluorochemicals including PFOA move rapidly in groundwater and migrate into nearby bodies of water.

108. By August 31, 1966, Defendant DuPont became aware that, without pretreatment, a small amount of perfluorocarboxylic acid (the class of perfluorochemicals to which PFOA belongs) dispersing agent, deposited in a landfill would be leached into the groundwater.

109. By May 13, 1975, Defendant DuPont employees in a memo entitled “Investigation of Current Teflon® Waste Disposal” stated: “The problems with disposing of ‘Teflon’ waste are fear of toxicity, either from ‘Teflon’ itself or additives in some products. Although fears of contamination of underground water supplies by ‘Teflon’ scrap may be exaggerated, the possibility of small amounts of undesirable materials such as ‘Triton’® and C-8 being present does exist. For this reason, we have elected to not landfill ‘Teflon’ waste at the local landfill, where large quantities of underground water serving both the Plant and the surrounding area are present.”

110. In 1982, Defendant DuPont knew that PFOA was contaminating the Ohio River and could be present in drinking water that came from the Ohio River. An internal DuPont memo dated October 19, 1982 cited analysis and projections of estimated human PFOA exposure from drinking contaminated Ohio River water.

111. On November 23, 1982, Defendant DuPont's then Medical Director, Bruce Karrh, MD, wrote in an internal memorandum that "[t]here is obviously great potential for current or future exposure of members of the local community from emissions leaving the Plant perimeter."

112. By 1984, Defendant DuPont became aware that PFOA in particulate form exhausted from stacks at its Washington Works plant was carried by the wind well beyond the Washington Works plant property line and deposited in the soil throughout the community. Defendant DuPont also learned that the drinking water supplies in communities around the Washington Works plant were contaminated with PFOA, presumably from air discharges from the plant of particulate matter that dissolved in rainwater and percolated into the groundwater and from direct discharges of liquids containing PFOA into the Ohio River.

113. By 1984, Defendant DuPont began a program of secretly collecting samples of tap water reported to be from public drinking water supplies near the Washington Works plant and determining their PFOA levels. DuPont found that PFOA was present in drinking water samples collected from locations in both Ohio and West Virginia in the vicinity of its Washington Works facility.

114. By June 1984, Defendant DuPont was aware that water supplied by the town of Little Hocking, Ohio, which was located "up-river" from the Washington Works plant contained PFOA levels of at least 500 ppt. Because of the location of the contaminated wells in Little Hocking in regards to the Washington Works facility and the direction of flow of the Ohio River, Defendant DuPont knew that this contamination was caused by PFOA released into the air from its manufacturing facility. Although Defendant DuPont knew that PFOA was persistent in the environment and that it was continuing to release PFOA into the air meaning that such releases

would likely increase the PFOA contamination in Little Hocking's drinking water, Defendant DuPont chose not to alert local, state or federal officials or the public.

115. By 1985, Defendant DuPont was aware that PFOA was leaching into groundwater beneath ponds that DuPont had previously used to dispose of PFOA contaminated sludge and was migrating through the groundwater under the plant into the public drinking water supply of Lubeck, WV, where DuPont found PFOA levels as high as 1,500 ppt. These PFOA levels increased to 1,900 ppt in 1987 and 2,200 ppt in 1988.

116. By 1987, Defendant DuPont had conducted air modeling at its Washington Works facility that documented PFOA in the ambient air beyond the fence line of the property and drifting with the wind into nearby communities.

117. On June 11, 1987, Dr. Karrh, Defendant DuPont's Medical Director, told DuPont officials that the Washington Works plant needed to give "highest priority" to issues associated with the presence of PFOA outside the boundaries of the plant.

118. In January 1992, Defendant DuPont completed its purchase of the Lubeck wellfield it had previously found to be contaminated with PFOA. It then tested the new wells that were being used by the Lubeck community for drinking water and found that these wells had even higher levels of PFOA than the old wells, even though the new wells were two miles further away from the Washington Works plant. DuPont chose not to disclose its findings regarding the PFOA levels in the new Lubeck wells. The contamination of these wells was not made public until 2001 when the West Virginia Division of Environmental Protection tested the drinking water in Lubeck.

119. In late 1998, Defendant 3M environmental scientist Richard Purdy wrote to his 3M colleague Georjean Adams and suggested that his food chain risk assessment of fluorochemicals

produced by 3M once they entered the environment demonstrated a risk that could not be kept confidential. In another email, Purdy stated “For 20 years the division has been stalling in the collection of data needed for evaluating the environmental impact of fluorochemicals. PFOS is the most onerous pollutant since PCB and you want to avoid collecting data that indicates it is probably worse.”

120. In 1999, Purdy drafted a resignation letter which stated: “3M told those of us working on the fluorochemical project not to write down our thoughts or have email discussions on issues because of how our speculations could be viewed in a legal discovery process. This has stymied intellectual development on the issue and stifled discussion of the serious ethical implications of decisions.”

121. Shortly after Defendant 3M decided to terminate its production of PFOA in 2000, groundwater near the 3M Cottage Grove facility in Minnesota was discovered to be highly contaminated with PFOA. Subsequently, perfluorinated compound (PFC) contamination including PFOA and PFOS was found in groundwater further away from the facility, in Washington and Dakota Counties. In Oakdale, MN the average PFOA concentration in the municipal water was 570 ppt. Closer to the Cottage Grove facility groundwater levels were measured as high as 619 ppb (619,000 ppt).

122. The State of Minnesota has determined that over 100 square miles of groundwater have been contaminated by Defendant 3M’s disposal of PFCs and the source of residential drinking water for over 125,000 Minnesotans has been affected by PFC waste disposal.

123. Upon information and belief, Defendants 3M and DuPont shared information about the environmental contamination potential of fluorochemicals such as PFOA and PFOS from as

far back as the 1980s and the information alleged to be known by one Defendant was made known to the other.

### **PFOA Drinking Water Limit**

124. In 2009, the EPA identified PFOA as an emerging contaminant of concern and issued a provisional health advisory stating that short term (weeks to months) exposure to PFOA at a concentration of 400 ppt can cause human health effects. The provisional health advisory stated that the discovery of PFOA in water above the advisory level should result in the discontinued use of the water for drinking or cooking.

125. Following EPA's action, in 2013, New Jersey established a preliminary health-based guidance level of 0.04 ppb (40 ppt) in drinking water.

126. In 2016, Vermont established a drinking water advisory of 0.02 ppb (20 ppt).

127. In May 2016, EPA replaced its 2009 provisional health advisory with a new lifetime advisory. The 2016 lifetime health advisory established that the presence of PFOA in drinking water at a concentration greater than 70 ppt should require water systems to undertake remediation and public health officials to promptly notify consumers about the health risks associated with exposure to PFOA. EPA health advisories are non-enforceable on the states. EPA also established a Reference Dose (RfD) of 0.000002 mg/kg/day. The Reference Dose is defined by EPA as an "estimate[] (with uncertainties spanning perhaps an order of magnitude) of the daily exposure to the human population (including sensitive subgroups) that is likely to be without an appreciable risk of deleterious effects during a lifetime." United States EPA, Health Effects Support Document for Perfluorooctanoic Acid (PFOA), p. 4-1 (May 2016).

128. In May 2017, Minnesota established a health guidance value for PFOA in drinking water of 0.035 ppb (35 ppt).

129. In November of 2017 the State of New Jersey announced it will adopt a new health-based Maximum Contaminant Level (MCL) for PFOA in drinking water to 14 ppt from its previously set level of 40 ppt based upon the recommendation of the New Jersey Drinking Water Quality Institute, which was based upon the latest research on the adverse health effects of PFOA.

130. At the time of this filing, numerous states are considering imposing limitations for the presence of PFOA in drinking water.

#### **PFOA Use in and around Hoosick Falls**

131. For several decades beginning as early as the late 1950s, PFOA was used in manufacturing processes at facilities in and around Hoosick Falls.

132. One of these facilities is a small factory located at 14 McCaffrey Street (“McCaffrey Street Site”). New York State has identified the McCaffrey Street Site as a probable source for the presence of PFOA in the Village municipal water supply and local aquifer. Indeed, the State has characterized the McCaffrey Street Site as a “significant threat to public health or the environment.”

133. The McCaffrey Street Site began operation in or about 1955. A company called Dodge Fibers Corporation owned and operated the factory at that time.

134. Upon information and belief, in or about 1967 Oak Materials Group, Inc. purchased the assets and liabilities of Dodge Fibers, including the McCaffrey Street Site.

135. Upon information and belief, in or about 1986, Allied-Signal Inc. purchased Oak Materials Group, Inc., which included the assets and liabilities of the McCaffrey Street Site. Allied-Signal operated the McCaffrey Street Site until 1996.

136. In addition, at or around the time that it purchased Oak Material Group, Allied-Signal merged Oak Materials Group with another acquisition, Norplex, to form Norplex-Oak.

137. Shortly thereafter, the Norplex-Oak business unit took over operations of the Hoosick Falls facilities, which included the McCaffrey Street Site, as well as 1 Liberty Street, a facility at John St./Lyman St., and at least four buildings on River Road.

138. The Hoosick Falls facilities were known within Allied-Signal as Fluorglas or the Fluorglas division.

139. Fluorglas used PFOA in its operations at the facilities at McCaffrey Street, 1 Liberty Street, John Street, and in at least one of the buildings on River Road.

140. Fluorglas purchased PTFE dispersions containing PFOA from DuPont and other manufacturers, who in turn had purchased PFOA from 3M.

141. Fluorglas also purchased PFOA from 3M.

142. Upon information and belief, in or about 1996, Allied-Signal sold some of the assets and liabilities of its Hoosick Falls facilities, including the McCaffrey Street Site, to Furon Company (Furon).

143. Upon information and belief, Allied-Signal did not sell all of the assets and liabilities in the Hoosick Falls facilities at this time. For example, Allied-Signal retained ownership of the facilities at John Street and River Road, both of which used PFOA in manufacturing processes both during and prior to Allied-Signal's ownership of those facilities.

144. Upon information and belief, in or about 1999, Defendant Saint-Gobain purchased the assets and liabilities of Furon, including the McCaffrey Street Site and the site at 1 Liberty Street.

145. Defendant Saint-Gobain has continuously owned and operated the McCaffrey Street Site from the time it purchased the Furon Company to the present.

146. Throughout the operation of the McCaffrey Street Site, Defendants Saint-Gobain and Honeywell (through its predecessors) manufactured stain and water resistant fabric coated with PTFE dispersion at the factory.

147. In manufacturing stain-resistant fabric, each company coated the fabric with a liquid solution containing PFOA (the “PFOA Solution”) manufactured by either Defendant DuPont or Defendant 3M.

148. Saint-Gobain, Furon, Allied-Signal, and Oak Materials utilized trays for the application of the PFOA dispersion to the fabric. Employees added the dispersion to the trays during production runs and recovered a portion of the dispersion at the end of the run each shift.

149. During the drying process, heat would vaporize a portion of the PFOA, which was discharged from the facility as fine particulate matter that was then transported by wind where it settled to the ground and contaminated the soil throughout to the community. Ultimately, PFOA traveled through the soil to the groundwater.

150. Defendants’ employees, at the direction of corporate officers, washed out and discharged the remaining PFOA Solution from the trays into drains on a daily basis during each shift. Those floor drains resulted in the discharge of PFOA into the soil and, in turn, into the aquifer.

151. On average, the McCaffrey Street Site ran three shifts, five days a week.

152. Saint-Gobain also utilized PFOA in other processes at the McCaffrey Street Site between 1999 and approximately 2004. Among other things, Saint-Gobain produced PTFE (polytetrafluoroethylene) film, adhesive tapes and silicone rubber for aeronautical, automotive, food processing and energy applications.

153. Saint-Gobain claims that it halted the use of PFOA in its fabric coating operations at the McCaffrey plant around 2004, and began using another fluorinated carbon chemical as a surfactant in manufacturing. Saint-Gobain continued to use PFOA in its silicone rubber operations at the plant until approximately 2014.

154. Throughout the period during which Oak Materials, Allied-Signal, Furon, and Saint-Gobain owned the McCaffrey facility and the facility on Liberty Street in Hoosick Falls, each company also used PFOA in a solid form as a part of a separate process to manufacture, *inter alia*, pressure-sensitive tapes, Teflon®-coated fabrics, and Teflon® sheet, tape and laminates. This PFOA was also manufactured by Defendants 3M or DuPont.

155. Oak Materials, Allied-Signal, Furon and Saint-Gobain utilized six large, approximately three-story ovens as a part of their PTFE and FEP coating manufacturing processes.

156. The use of the ovens produced a sticky residue that would adhere to the internal tubing or “stacks” within the oven, and PFOA comprised a part of that residue.

157. Each company established a rotation by which each oven and its stacks were cleaned once every six weeks, with a different oven cleaned every Monday.

158. Defendants Saint-Gobain’s and Honeywell’s employees removed the residue in the stacks by washing the stacks in a large sink that measured approximately 3 feet by 3 feet by 20 feet in size. At the end of each cleaning, the waste water from the cleaning was discharged

down a drain and may have been released into a septic system or catch basin near the McCaffrey plant. Those floor drains and other discharge points resulted in the discharge of PFOA into the soil and, in turn, into the aquifer.

159. In addition to the McCaffrey Street Site, New York State has identified the facilities at Liberty Street, John Street, and River Road as potential sources of PFOA contamination. The New York DEC has classified the Liberty Street Site as a “Class 2,” site, meaning that the site presents a significant threat to public health and/or the environment..

160. Saint-Gobain admits that from 1999 through 2014, its extruded tape department at the Liberty Street Site used raw materials that contained PFOA. This PFOA was also manufactured by either DuPont or 3M.

161. DEC has identified two additional sites, both formerly operated by Oak Materials and Allied-Signal, located on John Street/3 Lyman Street and River Road. DEC has classified the John Street Site as a “Class 2” Site. The River Road Site is classified as a “p-site” meaning that further investigation is required

162. DEC has also stated that its preliminary investigation has identified PFOA within the leachate coming from the former municipal landfill, and it has stated that it anticipates classifying the former landfill as a p-site in the near future. DEC has measured PFOA levels of 21,000 ppt within the leachate. The landfill is adjacent to the Hoosic River and leachate from the landfill continues to migrate towards and into the river.

163. Upon information and belief, Defendants Saint-Gobain and Honeywell discharged PFOA into the environment through other means and at other sites that will be revealed through the discovery process.

### **Disclosure of PFOA Contamination**

164. In or around 2007, the Village completed the construction of a new production well to supply municipal water to many of the residents of Hoosick Falls.

165. The production well lies approximately 500 yards away from the McCaffrey Street Site.

166. The Village conducted testing in fall 2014 that confirmed high levels of PFOA in the municipal water.

167. In June 2015, the Hoosick Falls Water Department conducted tests on the effluent from its production well(s) in order to discern whether PFOA existed within the water supply.

168. Shortly thereafter, the Village received the results from its production well(s) tests.

169. Those tests again confirmed the presence of high concentrations of PFOA within the municipal water system.

170. Testing of municipal water produced detections of 612 ppt, 618 ppt, 620 ppt, 151 ppt and 662 ppt for PFOA.

171. Upon information and belief, PFOA has been present in the municipal water system at comparable levels for several decades.

172. Similarly, the Village oversaw the testing of certain private wells within the Village in the summer of 2015, and received results that included detections that were significantly above any safe level.

173. The Village's response to these test results was to reassure individuals within the community that the water was safe to drink.

174. In October 2015, EPA Region 2 administrator Judith Enck learned of the PFOA test results taken in and around Hoosick Falls.

175. On November 25, 2015, the EPA contacted the Village and recommended the use of an alternative drinking water source. EPA further recommended that residents not use the municipal water for drinking and cooking.

176. In early December 2015, the DOH released a fact sheet for the Village. That fact sheet stated, in part, “Health effects are not expected to occur from normal use of the water.”

177. Village officials further minimized the potential risk of PFOA in the municipal water.

178. The EPA repeated its recommendation to the Village on December 17, 2015, after learning that Village officials were downplaying the first EPA notice and suggesting that whether or not an individual used municipal water was a matter of personal choice.

179. Unbeknownst to the community at the time, Saint-Gobain was privately negotiating with Village elected officials in an effort to minimize its liability.

180. Shortly after the EPA’s December 17 warning, Saint-Gobain began providing free bottled water to Village residents dependent on municipal water. Saint-Gobain also agreed to fund the installation of a granulated activated carbon filter system on the municipal water system to reduce the level of and/or remove PFOA from drinking water.

181. On January 14, 2016, Healthy Hoosick Water, a local community group, sponsored a public meeting with personnel from the EPA, the DOH and the DEC.

182. At that meeting, New York officials announced that New York State had submitted a letter that day seeking the designation of the McCaffrey Street Site as a state Superfund site.

183. During the mid-January meeting, residents dependent on private wells questioned state officials about whether their wells may also be contaminated. State officials indicated that the DOH would test the private wells of any individual upon request.

184. In fact, DOH put off testing most of the private wells in and around the Town of Hoosick and instead focused its resources on the wells nearest the McCaffrey Street Site.

185. The DOH avoided providing private well testing for several more weeks. In response to growing public outcry, however, the state finally reversed course and began testing the private well of anyone requesting it.

186. In mid-January, a consultant hired by the state sent an email to DOH employees stating that “all of the manufacturing in the village went to the ‘dump.’ Although the landfill was decommissioned and capped several years ago all of the potential PFOA rich leachate goes to the treatment plant and eventually out to the Hoosic River. It may be alarmingly high and we need to get at least a baseline level.” Testing later confirmed that wells and soil in close proximity to the Hoosick landfill were contaminated with PFOA. Indeed, one water sample taken from the landfill showed PFOA at a concentration above 21,000 ppt. Upon information and belief, Defendants Saint-Gobain and Honeywell discarded PFOA-laden waste at the landfill for years before it was decommissioned.

187. The Hoosick Falls school district announced on January 22, 2016, that testing identified PFOA within the well water at its transportation center.

188. On January 27, 2016, Governor Cuomo directed state agencies to use state Superfund money to address PFOA in the Hoosick Falls municipal water system. The State Health Commissioner said that the Saint-Gobain plant would be deemed a state Superfund site and designated it a Class 2 site.

189. That same day, the governor announced an emergency regulation to classify PFOA as a hazardous substance.

190. On January 28, 2016, the EPA advised that home owners with private wells should use bottled water if testing had uncovered PFOA level in their water at 0.1 ppb (100 ppt) or higher. The EPA further recommended that home owners with private wells should use bottled water if no one has yet tested their well water.

191. At that time, one or more local banks indicated that they would not advance funds for the purchase or refinancing of a home in Hoosick Falls. Indeed, the Treasurer of Trustco Bank, Kevin Timmons, publicly confirmed that the bank was not writing new mortgages for any home on the Village's municipal water supply. Timmons indicated that lenders typically require that homes have access to potable water before financing is approved.

192. Timmons further stated that financing would not be approved for homes on private wells until the water supply was tested for the presence of PFOAs and showed the absence (or a very low level) of PFOAs. Homeowners with private wells would later be required to prove that their water was not contaminated as a prerequisite to acquiring financing. Even when financing resumed, lenders offered interest rates that were much less favorable to borrowers than the rates offered in late 2015, prior to disclosure of PFOA contamination.

193. As a result of the presence of PFOA within the aquifer, the municipal water system, private wells, and on residential properties throughout Hoosick Falls, the property values in and around Hoosick Falls have experienced a significant decline since the presence of PFOA was disclosed in December 2015. That decline persists to this day and is expected to continue.

194. On or around February 1, 2016, United States Senator Charles Schumer called on Saint-Gobain to disclose immediately the full extent of the pollution it caused. Senator Schumer

stated, “Saint-Gobain did this. They’ve got to first come clean as to what happened, where they put the stuff, and then work on a plan to quickly clean it up.”

195. On February 5, 2016, news outlets reported that some Village residents were bathing by sponge because they were afraid of inadvertently ingesting water during a shower.

196. On February 11, 2016, DEC identified Saint-Gobain and Honeywell as the parties potentially responsible for PFOA contamination at one or more properties in Hoosick Falls, including the McCaffrey Street Site.

197. The DEC demanded at that time that each company enter into an enforceable Consent Order to characterize and investigate the extent of the contamination, to provide interim remedial measures to protect public health and drinking water supplies, to analyze alternatives for providing clean and safe drinking water and, ultimately, to design and implement a comprehensive clean-up and remediation protocol.

198. On February 13, 2016, DOH began offering blood testing to any Hoosick Falls residents who wished to have their blood tested for the presence of PFOA. Over 3,000 individuals have participated in this program to date.

199. By February 24, 2016, a newly installed carbon filtration system at the municipal water treatment plant became fully operational. This carbon filtration system was temporary, with a permanent filter to be installed by December 2016. In spite of the presence of the temporary filter, residents continued to rely on bottled water for drinking.

200. On February 26, 2016, state officials disclosed results from tests performed at private wells. Of 145 wells tested, 42 showed PFOA contamination above 100 ppt.

201. The DEC also announced at this time that it had commenced installation of POET systems for homes with private wells. DEC stated at that time that it had received 281 requests

for POETs. Throughout the spring, residents in and around Hoosick Falls would continue to deal with frustrations relating to installation and upkeep of POET systems. Requests for POET systems continued to mount, and as of the date of this Complaint the state has installed over 800 POET systems on private wells in and around Hoosick Falls. These POET systems must remain installed for the foreseeable future and require regular maintenance.

202. In early March 2016, the state disclosed results from water samples taken from the Hoosick Falls Water Treatment Plant in or around February 2016. The highest sample showed PFOA at a concentration of 983 ppt.

203. On June 3, 2016, DEC announced that it had reached agreement on two Consent Orders with Saint-Gobain and Honeywell. These Consent Orders require Defendants Saint-Gobain and Honeywell to, *inter alia*, conduct further study of the Liberty Street Site and the sites at John Street and River Road—each of which was classified as a p-site under New York law.

204. Around the same time as DEC's announcement, state officials began releasing the results of blood testing performed in February and March of 2016. Over the course of the following two months, DOH officials would release data gathered from testing over 3,000 individuals.

205. Numerous residents received blood tests indicating that PFOA was present in their blood at alarming levels. According to the DOH, the median blood level among those tested is 64.2 ug/L, a level that is 30 times higher than the national average level of 1.86 ug/L. The median for men 60 and over was 91 ug/L.

206. Virtually all of the long-time residents of Hoosick Falls had blood levels an order of magnitude or more above background levels of PFOA in their blood serum. Almost all of these long-time residents also had blood levels significantly above the 95th percentile of Americans.

207. Moreover, the vast majority of residents and former residents of Hoosick Falls have been exposed to PFOA at a level that meets or exceeds some health-based comparison value.

208. The results of the state's blood testing led to shock and fear among the residents of Hoosick Falls. Since the results were mailed, the State has been unable to provide any reasonable health guidance to those with elevated blood levels.

209. On July 8, 2016, United States Senator Kirsten Gillibrand echoed these concerns at a town hall meeting in Hoosick Falls. Senator Gillibrand emphasized the need for and creation of a biomonitoring program similar to the protocol implemented for first responders following the 9/11 World Trade Center attacks. To date, neither the Defendants Saint-Gobain and Honeywell nor the State has taken any action to implement such a program.

210. In November 2016, New York State formally named PFOA and PFOS as hazardous substances.

**Plaintiff R.M. Bacon – Neighborhood Business for 30+ Years**

211. Michael Bacon formed R.M. Bacon, LLC ("R.M. Bacon") in 1985.

212. R.M. Bacon is located in the Town of Hoosick, immediately south of Hoosick Falls.

213. Mr. Bacon grew up in Hoosick Falls and is a graduate of its high school.

214. The origins of the Company pre-date 1985, when Mr. Bacon purchased a dump truck during high school to begin a business delivering fill, gravel and other materials to customers.

215. The business has expanded over the years and through 2015, R.M. Bacon's primary operations centered on custom home construction and home improvements.

216. For that work, the Company served as the general contractor, performing parts of the work and overseeing the work of sub-contractors.

217. R.M. Bacon also performed excavations, deck installation, provided soil and fill to home owners, putting in roads on properties, leased out construction equipment and handled the storm maintenance work in the region (i.e., removed down trees, plowed roads and other related services).

218. In developing the business, R.M. Bacon made a number of infrastructure commitments that set the business apart from other companies in the immediate region. For example, the Company built an all-season facility with independent power to insure operations when regional storms cause power outages (indeed, Mr. Bacon makes his building available to area residents who have lost power so that they can get a hot shower or use the power for immediate, small needs).

219. The Company has an additional building, which it constructed to protect equipment and to perform in-house maintenance on equipment. In these capacities, R.M. Bacon also provided employment for residents of Hoosick Falls.

220. The Company has also made significant expenditures for its own equipment, such as the purchase of a screen plant to insure the quality of the soil and other fill.

221. R.M. Bacon expanded over time to become a company with over \$1 million in annual revenues.

222. R.M. Bacon's efforts and Mr. Bacon's connections within the community made the business the leading construction company in an approximate 25-mile radius of Hoosick Falls.

223. The Company, essentially, performed all excavation and roadway development work for all new commercial construction in the area between 2010 and 2015.

224. Similarly, the Company provided approximately 75 percent of this work for all private property development in the area through 2015.

225. R.M. Bacon, accordingly, has been the primary business in its field in the area for over a decade. Given the relative size of towns such as Hoosick and Hoosick Falls, R.M. Bacon was the first choice (and, frequently, only choice) for excavation and related work in the area.

#### **Defendants' Destruction of Plaintiff's Business**

226. The confirmation of the presence of PFOA in the groundwater in Hoosick Falls and the EPA's direction that residents no longer use tap or well water for drinking and cooking had a direct impact on the business operations of R.M. Bacon.

227. The absence of safe water for the residents in Hoosick Falls immediately negatively impacted residents' confidence in the safety of their homes.

228. Individuals and companies in Hoosick Falls lost the ability to get loans for the development or improvement of their properties as banks anticipated a sharp decline in property values.

229. Individuals were informed that their properties had lost value.

230. Hoosick Falls' residents became further concerned that any improvement to the property would become lost value as property values continued to decline due to the PFOA presence.

231. The resulting declaration of locations within the Village of Hoosick Falls as state Superfund sites further depressed property values and further reduced interest in property development in the area.

232. The New York State Department of Health's disclosure of test results for blood samples taken of local residents, revealing a significantly higher-than-average presence of PFOA in the blood of local residents, further negatively impacted property values.

233. People suddenly became distrustful of even the fill that R.M. Bacon provided, though it came from a different area, as they anticipated that the fill might contain PFOA.

234. The type of work that the Company previously performed disappeared in 2016, as a result of the announced presence of PFOA in the local groundwater.

235. For example, in 2015, R.M. Bacon performed excavating and construction work on a log cabin situated on an 800-acre property.

236. The owner of the property had intended to continue developing the property in 2016, as he worked towards a goal of developing the property into a horse farm and vacation spot. With the announcement of PFOA in the groundwater and the declaration of the area as a State Superfund site, the owner cancelled the development of the property.

237. While the Company had employed seven individuals for the previous five years, it was only employing three individuals by June 2016, along with one part-time employee.

238. R.M. Bacon had no construction or excavation work scheduled at the start of July 2016.

239. The Company performed a minimal amount of excavation work during the summer of 2016.

240. R.M. Bacon had previously obtained a low-interest, small business loan from the Department of Agriculture (USDA) and applied to the USDA for permission to make only interest payments for the next year to relieve some of the financial pressure on the Company. The USDA did provide small relief on the terms of the loan. That relief ended in 2017.

241. As of July 1, 2016, the company had no new contracts for 2016, and did not anticipate any new contracts for land development or road work for the remainder of the year.

242. In August, the company opted to schedule an auction for the sale of most of its equipment as a means of reducing overhead and costs. That auction took place on October 11, 2016.

243. By September 2016, Mike Bacon was the only remaining employee of R.M. Bacon and he was not receiving a regular salary for that work.

244. In October 2016, the Company sold several more pieces of large equipment at auction.

245. Individuals have expressly stated that the presence of PFOA in the environment prevents them from hiring R.M. Bacon.

246. As of December 31, 2016, no one had contacted R.M. Bacon for a work estimate, let alone to perform construction work for either the winter of 2016-17, or for 2017.

247. As of December 31, 2016, the company experienced a substantial loss of revenue for the 2016 fiscal year.

248. Plaintiff Michael Bacon holds the title for the property where R.M. Bacon operates on South Street in the Town of Hoosick, including the surrounding 90+ acres.

249. Michael Bacon sought to sell the property in 2016, and has listed the property at \$100,000 below the 2015 assessed value of the property and buildings for the past six months.

250. To date, plaintiff Michael Bacon has not received any offers for the property and no one has looked at the property.

251. R.M. Bacon anticipates that it will require at least five years for the company to return to the revenue levels that it enjoyed between 2010 and 2015, and that will occur only if something is done to address the presence of PFOA's in the groundwater and confidence is restored in the community.

252. A better-than-average chance also existed, however, that the consequences of the environmental contamination from PFOA will force the 31-year old company to cease operation during 2017 and that possibility continues.

## **CAUSES OF ACTION**

### **FIRST CLAIM FOR RELIEF**

#### **Strict Products Liability – Failure to Warn Against Defendants DuPont and 3M**

253. Plaintiffs hereby incorporates by reference the allegations contained in the preceding paragraphs of this Complaint as if they were set forth at length herein.

254. This Claim is brought under New York law.

255. From the 1950's through approximately 2000, Defendant 3M developed, tested, assembled, manufactured, packaged, labeled, prepared, distributed, marketed and/or supplied for sale and sold PFOA to Defendant DuPont and to other manufacturers of PTFE dispersions, and to Defendants Honeywell and Saint-Gobain in the ordinary course of their business.

256. From the 1950s through approximately 2015, Defendant DuPont developed, tested, assembled, manufactured, packaged, labeled, prepared, distributed, marketed and/or supplied PFOA-containing PTFE dispersion products for sale and sold such products to Defendants Honeywell and Saint-Gobain in the ordinary course of their business.

257. From approximately 2000 through approximately 2015, Defendant DuPont developed, tested, assembled, manufactured, packaged, labeled, prepared, distributed, marketed and/or supplied for sale PFOA and PFOA-containing PTFE dispersion products and sold such

products to other manufacturers of PTFE dispersions, and to Defendant Saint-Gobain in the ordinary course of its business.

258. By at least 1984, Defendants DuPont and 3M were aware of the health and environmental hazards associated with PFOA exposure as well as the potential for PFOA to contaminate soil and drinking water. Both Defendants were also aware that there were technologies that could reduce or eliminate the PFOA emissions for PTFE coating manufacturing facilities and/or that PFOA could be replaced in PTFE dispersions with another surfactant. Both Defendants chose to continue to sell PFOA and PFOA-containing PTFE dispersions and not to advise purchasers of the true hazards of PFOA or instruct them about and recommend emission reducing technologies because of concerns for loss of profits to these Defendants.

259. Upon information and belief, Defendants Honeywell and Saint-Gobain utilized the PFOA and PFOA-containing PTFE dispersion products supplied by Defendants DuPont and 3M in a reasonably foreseeable and intended manner and for such products' intended uses.

260. The PFOA products sold by Defendants DuPont and 3M to Defendants Honeywell and Saint-Gobain were unreasonably dangerous to manufacturing workers and to residents of Hoosick Falls and the surrounding area without adequate warnings and instructions to prevent discharge of PFOA into the environment, contamination of the soil and groundwater, and toxic accumulation inside of the bodies of residents.

261. Defendants DuPont and 3M knew or should have known that the PFOA products that they sold to Defendants Honeywell and Saint-Gobain would be discharged into the environment and cause contamination of the soil and water supply and create a significant environmental risk or hazard.

262. Defendants DuPont and 3M knew or should have known that the PFOA products that they sold to Defendants Honeywell and Saint-Gobain would be discharged into the environment and cause contamination of the soil and water supply of and toxic accumulation in the blood serum of residents living in the communities where their products were used.

263. Defendants DuPont and 3M had actual knowledge of the environmental and health hazards associated with PFOA ingestion through both animal studies conducted by researchers employed or contracted by such Defendants and through experience with each Defendant's own workers, but, upon information and belief, failed to communicate such information to relevant governmental agencies, or to foreseeable users of the materials, including employees handling and disposing of them at the Hoosick Falls facilities.

264. Defendants DuPont and 3M also failed to warn and alert purchasers and users or the public of their discoveries of extensive soil and groundwater contamination in communities located near their Washington Works (DuPont) and Cottage Grove (3M) facilities once these water supplies were determined to be contaminated with PFOA or other similar fluorochemicals produced by Defendant 3M.

265. Defendants DuPont and 3M failed to provide adequate instructions and warnings when their PFOA and PFOA-containing products were sold and accordingly sold products that were unreasonably dangerous for their intended use and defective, making them strictly liable for the injuries and damages sustained by plaintiffs.

266. Defendants DuPont and 3M breached their continuing duty to warn of defects in their products after learning of the extensive environmental contamination caused by PFOA in or near their own facilities and failing to pass this information on to purchasers, users and others in the communities where these products were utilized who could be adversely affected.

267. Had Defendants DuPont and 3M provided adequate warnings and instructions of the known health hazards and risk of environmental contamination of PFOA and their PFOA-containing products to purchasers, users, governmental agencies and the public, it is more likely than not that plaintiffs' injuries and damages would not have occurred or would have been lessened as actions would have been taken to reduce or eliminate and contamination of the environment in and around Hoosick Falls with PFOA.

268. Defendants 3M and DuPont acted with reckless indifference to the environment and to the health and safety of individuals in communities where their PFOA products were used by failing to provide adequate warnings of the known environmental and health dangers of PFOA when discharged into the environment and inhaled and ingested by nearby residents.

269. As a direct and proximate result of the sale of their defective PFOA product lacking proper warnings and instructions, plaintiff R.M. Bacon has lost revenues of approximately \$1,000,000 for 2016, as well as the ownership of equipment. Plaintiffs continued to suffer comparable injuries in 2017 and 2018, and the injuries are anticipated to continue. As a direct and proximate result of Defendants' actions and omissions described herein, plaintiff Michael Bacon's property has also diminished in value and lost approximately \$250,000 of its value (actual amount subject to expert appraisal) and plaintiff's use and enjoyment of his property has been diminished.

270. Plaintiffs seeks judgment against Defendants in an amount that exceeds the jurisdictional limits of all lower courts that might otherwise have jurisdiction over all causes of action, nominal, compensatory and punitive damages in an amount to be determined by a jury but no less than \$2,650,000, together with costs and disbursements of this action and interest from the date of verdict rendered thereon.

**SECOND CLAIM FOR RELIEF**

**Negligent Interference with Prospective Economic Advantage  
Against Defendants Saint-Gobain and Honeywell**

**(R.M. Bacon alone)**

271. Plaintiffs hereby incorporate by reference the allegations contained in the preceding paragraphs of this Complaint as if they were set forth at length herein.

272. Plaintiff R.M. Bacon, in November 2015, had existing economic relationships with individuals and companies to perform work during 2016.

273. Based on prior years' experience, Plaintiff would have developed additional economic relationships with individuals and companies in 2016 and beyond.

274. Plaintiff's position and reputation within the community produced other relationships that would have resulted in anticipated property work during 2016 and beyond.

275. As R.M. Bacon was the primary company in the region providing excavation and leveling work, along with other work for property development, Defendants knew or should have known of plaintiff's economic relationships within the community and plaintiff's leading role in the region for such services.

276. Defendants' conduct caused the release of PFOA into the environment. Those releases included, but are not limited to, direct discharges into soil, discharge through air emissions, and disposal at various locations around the community.

277. Defendants failed to exercise reasonable care in their handling of their manufacturing operations and associated waste disposals.

278. Defendants' actions disregarded federal and state law and disregarded industry practices for handling waste, including PFOA.

279. At all relevant times, Defendants were aware of the health, safety and environmental threats that PFOA presented and of the potential consequences if they mishandled their waste and discharges in an unsafe manner.

280. Defendants knew or should have known that use of PFOA and/or the discharge of PFOA was potentially hazardous to human health and the environment and required Defendants to take adequate safety precautions to ensure that PFOA was not released into the surrounding environment.

281. As a result of Defendants' actions, they have substantially contaminated the local environment, including the underlying aquifer, with PFOA.

282. Defendants' contamination of the environment has disrupted plaintiff's economic relationship with existing and future customers and the local community.

283. As a result, R.M. Bacon lost existing and future economic relationships, resulting in substantial economic losses in 2016 and beyond.

284. Defendants' wrongful conduct constitutes the primary, if not sole, cause of the harm that plaintiff has incurred.

285. Plaintiff, additionally, is entitled to punitive damages as a result of Defendants' egregious actions.

### **THIRD CLAIM FOR RELIEF**

#### **Intentional Interference with Economic Relationship Against Defendants Saint-Gobain and Honeywell**

**(R.M. Bacon alone)**

286. Plaintiffs hereby incorporate by reference the allegations contained in the preceding paragraphs of this Complaint as if they were set forth at length herein.

287. Plaintiff R.M. Bacon, in November 2015, had existing economic relationships with individuals and companies to perform work during 2016.

288. Based on prior years' experience, Plaintiff would have developed additional economic relationships with individuals and companies in 2016 and beyond.

289. Plaintiff's position and reputation within the community produced other relationships that would have resulted in anticipated property work during 2016 and beyond.

290. As R.M. Bacon was the primary company in the region providing excavation and leveling work, along with other work for property development, Defendants knew of plaintiff's economic relationships within the community and plaintiff's leading role in the region for such services.

291. Defendants' conduct caused the release of PFOA into the environment. Those releases included, but are not limited to, direct discharges into soil, discharge through air emissions, and disposal at various locations around the community.

292. Defendants failed to exercise reasonable care in their handling of their manufacturing operations and associated waste disposals.

293. Defendants' actions disregarded federal and state law and disregarded industry practices for handling waste, including PFOA.

294. At all relevant times, Defendants were aware of the health, safety and environmental threats that PFOA presented and of the potential consequences if they mishandled their waste and discharges in an unsafe and hazardous manner.

295. Defendants knew or should have known that use of PFOA and/or the discharge of PFOA was potentially hazardous to human health and the environment and required Defendants

to take adequate safety precautions to ensure that PFOA was not released into the surrounding environment.

296. Further, Defendants deliberately withheld information about their handling of waste containing PFOA. Additionally, Defendant St. Gobain withheld knowledge of community-wide contamination of the groundwater with PFOA from the McCaffrey Street facility, in direct disregard for the economic relationships of Plaintiff within the community, as well as the health and safety of the community.

297. As a result of Defendants' actions, they have substantially contaminated the local environment, including the underlying aquifer, with PFOA.

298. Defendants' contamination of the environment has disrupted plaintiff's economic relationship with existing customers and the local community.

299. As a result, R.M. Bacon lost existing economic relationships and future economic relationships as well and resulting in annual losses of \$750,000 or more for the foreseeable future.

300. Defendants' wrongful conduct constitute the primary, if not sole, cause of the harm that plaintiff has incurred.

301. Plaintiff, additionally, is entitled to punitive damages as a result of Defendants' egregious actions.

#### **FOURTH CLAIM FOR RELIEF**

##### **Tortious Interference with Business Relationship Against Defendants Saint-Gobain and Honeywell**

**(R.M. Bacon)**

302. Plaintiffs hereby incorporate by reference the allegations contained in the preceding paragraphs of this Complaint as if they were set forth at length herein.

303. Plaintiff R.M. Bacon has a series of ongoing business relationships with various companies in and around Hoosick Falls.

304. Those relationships include work with Pro-Builders Construction Co. (Hoosick Falls), Hathaway Electric Inc. (Bennington, VT), Man of Kent Tavern (Hoosick Falls), JMP Foundation, Inc., T-Masonry & Building Services (Hoosick Falls), Nate Case Remodeling and other businesses within the region.

305. Defendants' contamination of the environment has interfered with plaintiff's existing business relationships and ability to obtain work with those companies.

306. Defendants' contamination of the environment, through both the discharge to the ground and releases into the atmosphere, was in reckless or willful disregard of their obligation to safely and properly manage and dispose of Defendants' waste products from their manufacturing operations.

307. Defendants' acts and their consequences adversely impacted plaintiff's business relationship with the identified businesses and other, similar businesses through the elimination of the work that plaintiff had performed in the past.

308. As a result, R.M. Bacon lost existing business relationships resulting in substantial economic losses in 2016 and beyond.

309. Defendants' wrongful conduct constitutes the primary, if not sole, cause of the harm that plaintiff has incurred.

310. Plaintiff, additionally, is entitled to punitive damages as a result of Defendants' egregious actions.

**FIFTH CLAIM FOR RELIEF**

**Negligence Against All Defendants  
By Both Plaintiffs**

311. Plaintiffs hereby incorporate by reference the allegations contained in the preceding paragraphs of this Complaint as if they were set forth at length herein.

312. At the relevant times specified above, Defendants owned and operated the various facilities in Hoosick Falls that utilized PFOA.

313. This Claim is brought under New York law.

314. Defendants 3M and DuPont knew or should have known that PFOA and PTFE dispersions containing PFOA that were used in the manufacturing processes at Defendants Honeywell's and Saint-Gobain's facilities would result in the release into the environment of PFOA, the contamination of the soil and groundwater, ingestion of that groundwater by the community of Hoosick Falls, accumulation of PFOA in the bodies of members of that community, including Plaintiff, and adverse health effects to those people, including Plaintiff.

315. All Defendants knew or should have known that use of PFOA, PFOA-containing PTFE dispersions and/or the discharge of PFOA into the air, ground and sewer system was potentially hazardous to human health and the environment and required Defendants to take adequate safety precautions to ensure that PFOA was not released into the surrounding environment.

316. Defendants knew or should have known that use of PFOA Solution and/or the disposal and discharge of PFOA Solution was potentially hazardous to human health and the environment and required Defendants to take adequate safety precautions to ensure that PFOA was not released into the surrounding environment.

317. All Defendants further knew or should have known that it was unsafe and/or unreasonably dangerous to wash out and/or discharge filters or trays containing PFOA-containing PTFE dispersions onto the ground within floor drains in, and in close proximity to, the McCaffrey Street, Liberty Street and other facilities operated by Defendants Saint-Gobain and Honeywell in Hoosick Falls.

318. Defendants further knew or should have known that it was unsafe and/or unreasonably dangerous to wash out and/or discharge into the environment the residue from the manufacturing ovens and their stacks where PFOA-containing PTFE dispersions were used.

319. During some of the years of the operation of PTFE coating manufacturing facilities in Hoosick Falls' Defendants 3M and DuPont failed to share information and knowledge that these companies had and to provide adequate warnings and instructions to Defendants Honeywell and Saint-Gobain about the hazards of PFOA to the environment and to the safety of the community.

320. At some point in time after use of PFOA at the Hoosick Falls facilities began, either based upon information provided by Defendants 3M and/or DuPont, or through published and available literature, Defendants Saint-Gobain and Honeywell, knew or should have known of the environmental risks and health hazards associated with exposure of human beings to PFOA.

321. Defendants 3M and DuPont had a continuing duty to warn purchasers of their PFOA and PFOA-containing products of risks and hazards learned by such Defendants after sale of these products.

322. Defendants further knew or should have known that it was unsafe and/or unreasonably dangerous to permit PFOA vapors and particulate matter to exit from stacks at the facility without adequate control measures.

323. Defendants Saint-Gobain and Honeywell had a duty to take all reasonable measures to ensure that PFOA-containing PTFE dispersions and/or PFOA would be effectively contained and not discharged or released into the surrounding environment.

324. Defendants Saint-Gobain and Honeywell further had a duty to ensure that the manufacturing processes they chose to employ did not unreasonably endanger the soil and drinking water relied upon by residents of Hoosick Falls and the surrounding area.

325. Defendants Saint-Gobain and Honeywell had a further duty, once the release of PFOA into the environment was discovered, to immediately and diligently investigate and address PFOA disposal methods in order to stop the release or spread of the contaminant.

326. Defendants Saint-Gobain and Honeywell breached the above-stated duties by unreasonably disposing of PFOA Solution and/or releasing PFOA in a manner that guaranteed PFOA would enter the environment, including the soil and groundwater.

327. Defendants 3M and DuPont had a duty to warn users of their PFOA products of the dangers of releasing PFOA into the environment and breached that duty by failing to disclose information they possessed about the health hazards associated with PFOA exposure, the propensity of PFOA to cause environmental contamination of soil and drinking water and the bioaccumulation of PFOA in people ingesting such contaminated drinking water.

328. Defendants 3M and DuPont further breached their continuing duties to warn about the dangers of PFOA learned after the manufacture and sale of their PFOA and PFOA-containing products to Defendants Saint-Gobain and Honeywell.

329. Defendants 3M and DuPont breached the above-stated duties by failing to adequately warn and provide sufficient instructions to foreseeable users of the products including employees handling and disposing of the products at the Hoosick Falls facilities, and to avoid discharging PFOA into the environment where it was likely to enter the soil and ground water and be ingested by residents such as Plaintiff.

330. Had Defendants DuPont and 3M provided adequate warnings and instructions of the known health hazards and risk of environmental contamination of PFOA and their PFOA-containing products to purchasers, users, governmental agencies and the public, it is more likely than not that Plaintiff's injuries and damages would not have occurred or would have been lessened as actions would have been taken to reduce or eliminate Plaintiff's exposure to PFOA before toxic accumulation in the body and environment occurred.

331. As a result of Defendants' breaches of the various duties set forth above, the soil and drinking water in and around Hoosick Falls, New York became contaminated with unsafe levels of PFOA. Indeed, Defendants, through the negligent, reckless and/or intentional acts and omissions alleged herein, have contaminated both the municipal drinking water and drinking water of private wells in Hoosick Falls and the surrounding area, as well as contaminated the property and land in the area.

332. Defendants' breach of their duty caused economic conditions to collapse in Hoosick Falls and a resulting collapse in the business operations of R.M. Bacon. Due solely to Defendants' breach of their duty, no property development occurred in the Village during 2016 and plaintiffs was injured.

333. Defendants' contamination of the environment has also stigmatized the local community and will adversely impact development in the community for the foreseeable future.

334. As a direct and proximate result of Defendants' actions and omissions described herein, plaintiff R.M. Bacon has lost revenues of approximately \$1,000,000 for 2016, as well as the ownership of equipment. Plaintiffs continued to suffer comparable injuries in 2017 and 2018, and the injuries are anticipated to continue.

335. As a direct and proximate result of Defendants' actions and omissions described herein, plaintiff Michael Bacon's property has also diminished in value and lost approximately \$250,000 of its value.

336. Plaintiffs seeks judgment against Defendants in an amount that exceeds the jurisdictional limits of all lower courts that might otherwise have jurisdiction over all causes of action, nominal, compensatory and punitive damages in an amount to be determined by a jury but no less than \$2,650,000, together with costs and disbursements of this action and interest from the date of verdict rendered thereon.

### **SIXTH CLAIM FOR RELIEF**

#### **Gross Negligence Against Saint Gobain and Honeywell By Both Plaintiffs**

337. Plaintiffs hereby incorporate by reference the allegations contained in the preceding paragraphs of this Complaint as if they were set forth at length herein.

338. Defendants Saint-Gobain's and Honeywell's acts and omissions resulting in the massive release of PFOA into the environment demonstrate want of even scant care or an extreme departure from the ordinary standard of care. Both Defendant may also be responsible for similar releases at 1 Liberty Street. Defendant Honeywell may also be responsible for similar releases of PFOA from the Oak Materials Site, a facility at John St./Lyman St., and at least four buildings on River Road

339. Defendants Saint-Gobain's and Honeywell's failure to adequately manage, handle or oversee the disposal of its waste containing PFOA, and in particular to prevent a massive release of PFOA into the environment, and subsequent failure to contain that release, amounts to an extreme departure from what a reasonably careful person would do in the same situation to prevent harm to others.

340. Defendants Saint-Gobain and Honeywell knew or should have known that the haphazard and indiscriminate discharge of waste containing PFOA into the environment posed a threat of significant danger to the environment and to the health and well-being of the nearby community and residents of the Village of Hoosick Falls.

341. Defendants Saint-Gobain's and Honeywell's acts and omissions therefore demonstrate want of even scant care or an extreme departure from the ordinary standard of care, amounting to gross negligence.

342. Defendants' gross negligence was the proximate cause of all of the Plaintiffs' injuries and damages.

343. Defendants Saint-Gobain and Honeywell are liable to Plaintiffs for all damages arising from Defendants Saint-Gobain's and Honeywell's wrongful conduct, including compensatory and exemplary relief.

344. Plaintiffs seek judgment against Defendants Saint-Gobain and Honeywell in an amount that exceeds the jurisdictional limits of all lower courts that might otherwise have jurisdiction over all causes of action, nominal, compensatory and punitive damages in an amount to be determined by a jury but no less than \$2,650,000, together with costs and disbursements of this action and interest from the date of verdict rendered thereon.

**SEVENTH CLAIM FOR RELIEF**

**Negligence Per Se Against Saint Gobain and Honeywell  
By Both Plaintiffs**

345. Plaintiffs hereby incorporate by reference the allegations contained in the preceding paragraphs of this Complaint as if they were set forth at length herein.

346. Defendants Saint-Gobain's and Honeywell's acts and omissions violate multiple federal and state statutes and regulations.

347. These statutes create a duty that Defendants owed to all members of the community for the proper handling, management and disposal of chemicals or hazardous waste and protected the members of the community from any individual, entity or corporation from polluting the local environment. Federal and New York State laws and regulations expressly prohibit or carefully manage the release or discharge of contaminants into the environment.

348. Defendants Saint-Gobain's and Honeywell's actions include the disposal of PFOA without the proper authorization and the release of PFOA into the environment, including discharges into the neighboring soil and air emissions into the general vicinity.

349. As a result of Defendants Saint-Gobain's and Honeywell's actions, PFOA is present on the Plaintiff's property.

350. By way of example, Defendants have violated New York State Environmental Conservation laws §§ 17-0501, 27-0914 and 37-0107.

351. Defendants Saint-Gobain and Honeywell, in releasing PFOA into the atmosphere, have violated New York laws and regulations, including 6 NYCRR § 200.6 and 6 NYCRR § 211.1.

352. Violations of statutory provisions and regulatory obligations constitute negligence per se.

353. Defendants Saint-Gobain's and Honeywell's violations have interfered and adversely impacted R.M. Bacon's operations and business opportunities.

354. Defendants Saint-Gobain's and Honeywell's failure to adequately manage, handle or oversee the disposal of its waste containing PFOA, and in particular to prevent a massive release of PFOA into the environment, and subsequent failure to contain that release, amounts to an extreme departure from what a reasonably careful person would do in the same situation to prevent harm to others.

355. Defendants Saint-Gobain and Honeywell knew or should have known that the haphazard and indiscriminate discharge of waste containing PFOA into the environment posed a threat of significant danger to the environment and to the health and well-being of the nearby community and residents of the Village of Hoosick Falls.

356. Defendants Saint-Gobain's and Honeywell's contamination of the environment has also stigmatized the local community and will adversely impact development in the community for the foreseeable future.

357. As a direct and proximate result of Defendants Saint-Gobain's and Honeywell's actions and omissions described herein, plaintiff R.M. Bacon has lost revenues of approximately \$1,000,000 for 2016, as well as the ownership of equipment. Plaintiffs continued to suffer comparable injuries in 2017 and 2018, and the injuries are anticipated to continue.

358. As a direct and proximate result of Defendants Saint-Gobain's and Honeywell's actions and omissions described herein, plaintiff Michael Bacon's property has also diminished in value and lost approximately \$250,000 of its value.

359. Plaintiffs, accordingly, seek damages from Defendants Saint-Gobain and Honeywell in an amount that a jury shall determine but will be no less than \$2,650,000.

**EIGHTH CAIM FOR RELIEF**

**Strict Liability for Abnormally Dangerous Activities  
Against Defendants Saint-Gobain and Honeywell  
By Both Plaintiffs**

360. Plaintiffs hereby incorporates by reference the allegations contained in the preceding paragraphs of this Complaint as if they were set forth at length herein.

361. Defendants Saint-Gobain's and Honeywell's manufacturing processes and negligent, reckless, and/or intentional handling of PFOA Solution and/or PFOA constituted an abnormally dangerous activity for which Defendants are strictly liable.

362. Defendants Saint-Gobain's and Honeywell's use and disposal of PFOA Solution, PFOA or other waste containing PFOA, as described herein, was inappropriate to the place where it was carried out, especially given the close proximity of the McCaffrey Street Site and the p-sites identified herein to sources of drinking water relied upon by residents of Hoosick Falls, including Plaintiff.

363. Furthermore, Defendants' use and disposal of PFOA, and reckless disregard for the consequences of those actions, carried a high degree of risk of harm to others and a likelihood that any such harm would be great. Indeed, the result of Defendants' conduct is all too clear. The State of New York has, *inter alia*, declared the McCaffrey Street Site a Superfund site, it may designate other facilities in the Village as Superfund sites, and it has activated emergency funds to remediate the situation.

364. As a result of Defendants Saint-Gobain's and Honeywell's abnormally dangerous activities, Plaintiff injuries and damages identified above and continue to suffer harm.

365. Plaintiffs seek a judgment against Defendants Saint-Gobain and Honeywell in an amount that exceeds the jurisdictional limits of all lower courts that might otherwise have

jurisdiction over all causes of action, nominal, compensatory and punitive damages in an amount to be determined by a jury but no less than \$2,400,000, together with costs and disbursements of this action and interest from the date of verdict rendered thereon.

**NINTH CLAIM FOR RELIEF**

**Trespass Against Defendants Saint-Gobain and Honeywell**

**(Michael Bacon alone)**

366. Plaintiff Michael Bacon hereby incorporate by reference the allegations contained in the preceding paragraphs of this Complaint as if they were set forth at length herein.

367. Plaintiff Michael Bacon holds the title for the property where R.M. Bacon operates on South Street in the Town of Hoosick, including the surrounding 90+ acres.

368. PFOA has been detected at the property and a POET system was installed.

369. Defendants Saint-Gobain and Honeywell negligently, recklessly, and/or intentionally failed to properly control, apply, use and/or dispose of PFOA Solution and/or PFOA or other waste containing PFOA, such that Defendants Saint-Gobain and Honeywell proximately caused PFOA contaminants to enter, invade, intrude upon and injure the right of plaintiff Michael Bacon to possess his property.

370. Plaintiff Michael Bacon has not consented, and do not consent, to the contamination alleged herein. Defendants Saint-Gobain and Honeywell knew or reasonably should have known that plaintiff would not consent to this trespass.

371. As a direct and proximate result of Defendants' actions and omissions described herein, plaintiff Michael Bacon's property has also diminished in value and lost approximately

\$250,000 of its value (actual amount subject to expert appraisal) and plaintiff's use and enjoyment of his property has been diminished.

372. As a direct and proximate result of Defendants Saint-Gobain's and Honeywell's acts and omissions as alleged herein, the plaintiff's property became contaminated with PFOA, causing significant property damage, including actual, consequential, and nominal damages.

### **JURY DEMAND**

Pursuant to Federal Rule of Civil Procedure 38(b), Plaintiffs demand a trial by jury of any and all issues in this action so triable of right.

### **PRAYER FOR RELIEF**

Plaintiffs request that the Court enter judgment in their favor and against Defendants, awarding as follows:

1. Actual, general, special, incidental, statutory, compensatory, and consequential damages in an amount to be proven at trial, but which will meet or exceed \$2,650,000;
2. Punitive and exemplary damages due to Defendants' malice detailed above;
3. All costs including reasonable attorneys' fees, court costs, and other litigation expenses;
4. Pre- and post-judgment interest
5. All such other relief as the Court deems just and proper.

Dated: December 31, 2018  
New York, New York
